

Sensory Weave page:

Head line:

“Therapy alone is not enough” because “true progress begins with regulation, connection, and readiness to learn.”

Sensory Weave is a developmental system which integrates multiple therapy perspective into one exclusively designed for children with Speech delay, Autism and ADHD

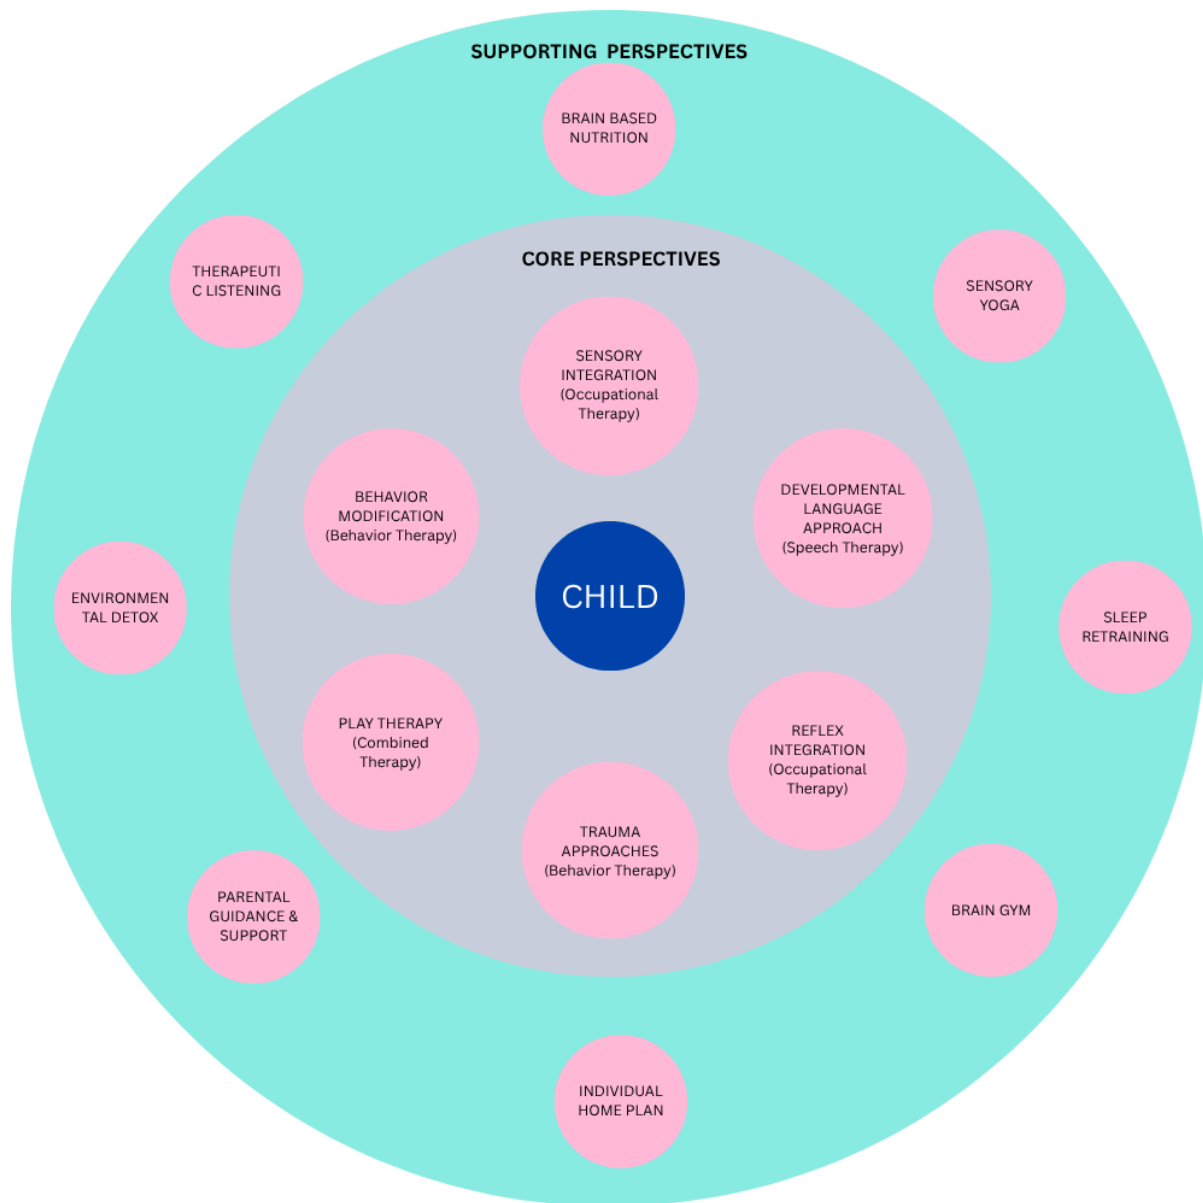

Not separate therapies- one interconnected system

Multidimensional Approach- Primitive reflexes, Brain nutrition & Sensory Yoga

Clear therapy pathway- Know what development comes next

Extends beyond therapy room- Parent support & home plan

Our multidimensional model : Based on recent developments in the field of Neurosciences

Development is not divided into OT, speech, or behavior therapy—it happens through connected phases.

The four phases of Sensory Weave

PHASE 1 — REGULATION

The child is learning to feel safe, calm, and organized.

You may notice:

- Frequent meltdowns
- Hyperactivity or sensory seeking
- Difficulty sitting or attending
- Poor sleep patterns
- Emotional overwhelm

PHASE 2 — ENGAGEMENT

The child begins to connect with people, surroundings, and communication.

You may notice:

- Increased eye contact
- Better response to name
- More engagement with others
- Improved imitation
- Seeking interaction more often

PHASE 3 – SKILL ACQUISITION

The child starts developing functional skills.

You may notice:

- Better understanding of instructions
- Improved speech and communication
- Increased participation in tasks
- Better play skills
- Improved motor coordination

PHASE 4 – FUNCTIONAL INTEGRATION

Skills begin transferring into daily life naturally.

You may notice:

- Better behavior regulation
- Improved classroom participation
- Social interaction improves
- Reduced dependence on prompts
- Better adaptability to routines

CTA: Take a test to know in which phase your child is [\(Quiz page\)](#)

“Every child moves through these phases differently, and progress is built through small, meaningful changes over time.”

ROADMAP TO SENSORY WEAVE

Integrative Assessment → Goal setting → Phase 1 Therapy → Home Integration → Progress Tracking

How we help?

Instead of Occupational Therapy, Speech Therapy, and Behavioral Therapy working separately with different goals, our Integrated Goal System brings every therapy approach together under one meaningful developmental objective.

Traditional therapy models often focus on:

- **separate sessions**
- **separate targets**
- **separate progress tracking**

This can sometimes make progress feel disconnected or inconsistent.

Child's development is quicker under Integrated goal model.

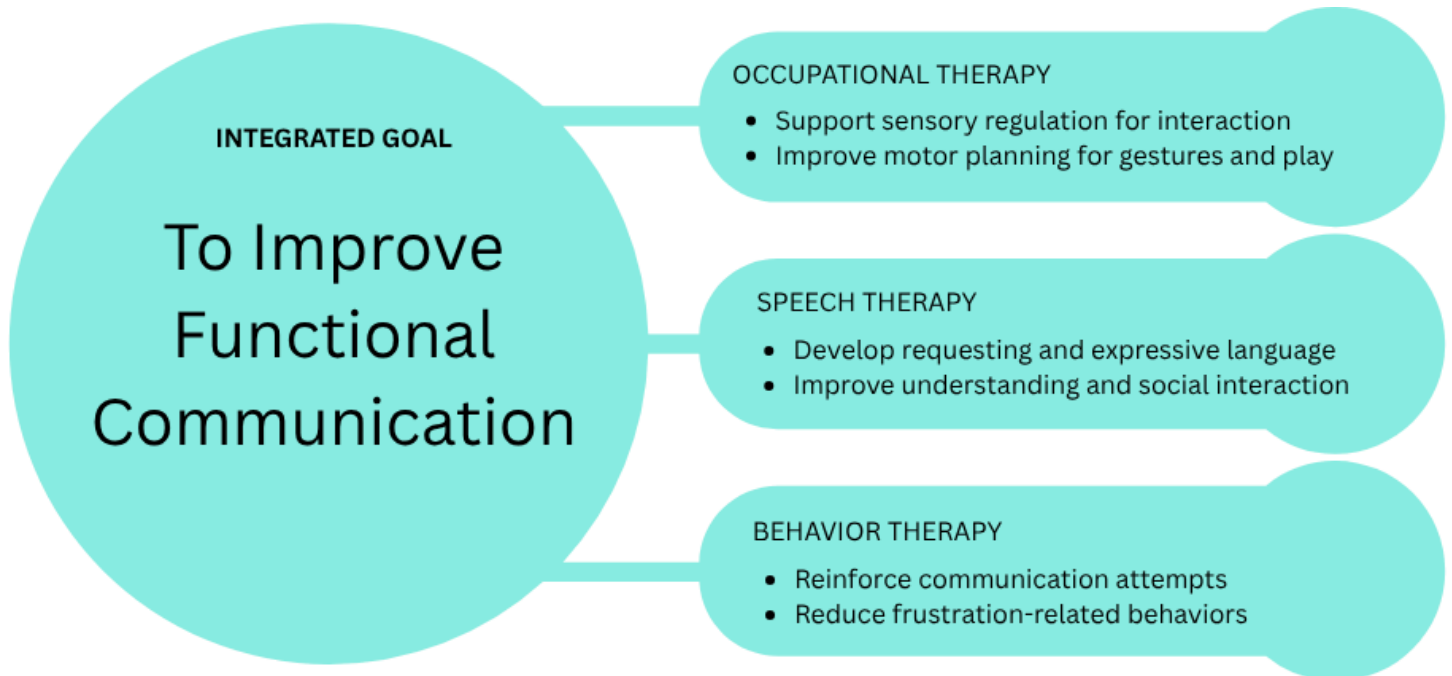

The Integrated Goal System ensures that:

- ✓ **every therapist works toward the same developmental outcome**
- ✓ **goals are connected across therapies**

✓ the child experiences more consistent learning and reinforcement

Same goal but different approach
